                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 13
            This sequence represents the human neuropeptide Y (NPY) receptor subtype YI The CDNA encoding this sequence was isolated from human fetal brain and human adult hippocampus cDNA libraries, using the primers given in 240766-67 which correspond to position 672-594 and 48-78 in the rat cDNA clone FCSR, respectively. The longest isolated clone encoded the human NPY receptor subtype YI. This clone was used to probe a human quenchic library which lead to the isolation of the clone kC (see also R35494) which contains the NPY YI receptor gene. The human NPY YI receptor consists of 3 exons and covers approx. 10 kb. The first 57 nuclectides of the 5 untranslated sequence of the human hippocampa! NPY YI receptor mPNA are separated by a 6 kb intron from the second exon. The second intron containing As in figure stop

The human NPY II receptor consists of 3 exons and covers approx. 10 kb. The first 57 uncleotides of the 5' untranslated sequence of the human hippocampal NPY YI receptor mRNA are separated by a 6 kb intron from the second exon. The second intron containing an in frame stop codon, is located exact. The second intron containing an in frame stop codon, is located exactly after the fifth transmembrane domain at nucleotide 408 of the element of the third cytoplasmic loop of the receptor is thought form a specific domain involved in determination of the specificity of coupling to different 6 proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Deta-udrenergic neuropeptide Y (NFY) receptor lead to less of functive. I about a relative myslass a time time of a Receive in binding interference. Similar alterations in the NFY receptor may also I to 5-protein interference and modified 2nd messenger responses. I modified NFY receptor can be used to identify compounds that modulate modified NFY receptor activity. These, then identified agonists, antagonists, suppressors and inducers can then be used treat obesity, diabetes, anxiety, hypertension, congestive heart treat obesity, diabetes, anxiety, hypertension, congestive heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        failure, cardiac and cerebral vasospasm, pheochromocytoma and ganglioneuroblastoma, as well as Huntingdon's, Alzheimer's and Parkinson's diseases. This deletion mutant had a 13 residue sequence removed which preceded the Arg residue formerly at position 286 (See WOSOLY for the wild type sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neurospeptide Y receptor modified in third intracellular domain secful to identify modulators of receptor activity for treating e.g. chesity, diabetes, hypertension, congestive heart failure, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

Endaminiology 137:3469-3477(996).
-:- EUNCLICH: HIGH AFFINITY PECEPTOR FOR MELATONIN. LIKELY TO MEDIATES
-:- EUNCLICH: HIGH AFFINITY PECEPTOR OF MELATONIN. THE ACTIVITY
OF THIS RECEPTOR IS MEDIATED BY PRETUSSIS TOXIN SENSITIVE G
PROTEINS THAT INHIBITS ADENVIATE OFCHASE ACTIVITY (BY SIMILARITY).
-!- SUBCELULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
-!- SUBCELULAR LOCATION: TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.

Bicchim Biophys Acta 1350 (2020-107) 1997

THE REPRODUCTIVE AND CIFCADIAN ACTIONS OF MELATONIN THE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY PERTUSSIS TOXIN SENSITIVE G PROTEINS THAT INHIBITS ADENYLATE CYCLASE ACTIVITY

--- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN COUPLED MECHANISMS.

--- SIMILARITY: RELONGS TO FAMILY 1 OF 3-PROTEIN COUPLED MECHANISMS.
